

Problem 7

In each of Problems 1 through 12:

- (a) Draw a direction field for the given differential equation.
- (b) Based on an inspection of the direction field, describe how solutions behave for large t .
- (c) Find the general solution of the given differential equation, and use it to determine how solutions behave as $t \rightarrow \infty$.

$$y' + 2ty = 2te^{-t^2}$$
