

## Problem 36

The method outlined in Problem 30 can be used for any homogeneous equation. That is, the substitution  $y = xv(x)$  transforms a homogeneous equation into a separable equation. The latter equation can be solved by direct integration, and then replacing  $v$  by  $y/x$  gives the solution to the original equation. In each of Problems 31 through 38:

- (a) Show that the given equation is homogeneous.
- (b) Solve the differential equation.
- (c) Draw a direction field and some integral curves. Are they symmetric with respect to the origin?

$$(x^2 + 3xy + y^2) dx - x^2 dy = 0$$
