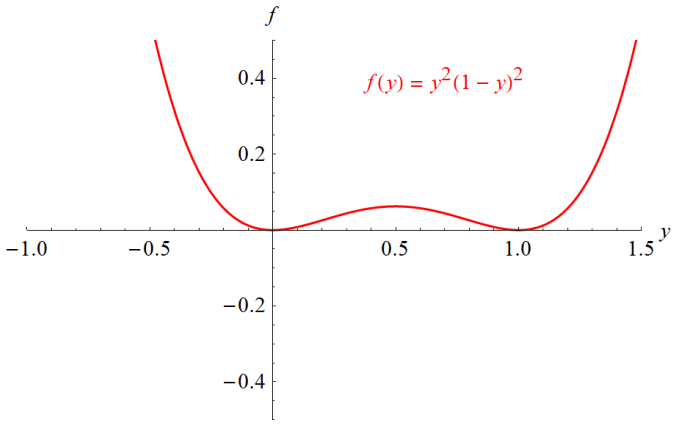
Problem 13

Problems 8 through 13 involve equations of the form $dy/dt = f(y)$. In each problem sketch the graph of $f(y)$ versus y, determine the critical (equilibrium) points, and classify each one asymptotically stable, unstable, or semistable (see Problem 7). Draw the phase line, and sketch several graphs of solutions in the ty-plane.

$$dy/dt = y^2(1-y)^2, \qquad -\infty < y_0 < \infty$$

Solution

In this problem $f(y) = y^2(1-y)^2$. Below is a graph of $f(y)$ versus y.



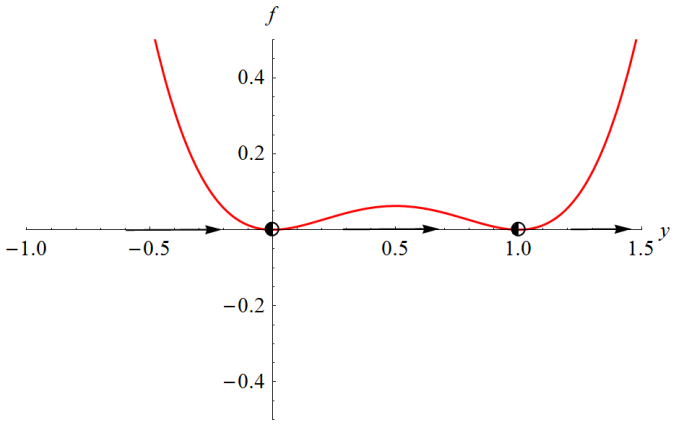
The equilibrium solutions are found by solving $f(y) = 0$ for y.

$$y^2(1-y)^2 = 0$$

$$y^2 = 0 \quad \text{or} \quad (1-y)^2 = 0$$

$$y = \{0, 1\}$$

As indicated below by the half-filled circles at $y = 0$ and $y = 1$, the equilibria are stable from the left but unstable from the right. They are said to be semistable.



The arrows pointing right on the y-axis (phase line) mean that y is increasing in time.

Some possible solution curves in the ty-plane for $t \geq 0$ are shown below. At every point, they are tangent to the direction field vectors $\langle 1, y^2(1-y)^2 \rangle$.
