

Exercise 32

For the following exercises, use the vertical line test to determine whether each of the given graphs represents a function. **Assume that a graph continues at both ends if it extends beyond the given grid.** If the graph represents a function, then determine the following for each graph:

- Domain and range
- x -intercept, if any (estimate where necessary)
- y -intercept, if any (estimate where necessary)
- The intervals for which the function is increasing
- The intervals for which the function is decreasing
- The intervals for which the function is constant
- Symmetry about any axis and/or the origin
- Whether the function is even, odd, or neither

Solution

The given graph does not represent a function because it does not pass the vertical line test.

$$\text{Domain: } \{x \mid 0 \leq x < \infty\}$$

$$\text{Range: } \{y \mid -\infty < y < \infty\}$$

The x -intercepts are points where the function touches the x -axis.

$$x\text{-intercepts: } (0, 0)$$

The y -intercepts are points where the function touches the y -axis.

$$y\text{-intercepts: } (0, 0)$$

There is symmetry about the x -axis.
