Exercise 295

For the following exercises, use the change-of-base formula and either base 10 or base e to evaluate the given expressions. Answer in exact form and in approximate form, rounding to four decimal places.

$$\log_{0.5} 211$$

Solution

In order to evaluate this expression, set it equal to an unknown variable x.

$$\log_{0.5} 211 = x$$

The base is 0.5, the exponent is x, and the result is 211.

$$0.5^x = 211$$

To solve for x, take the logarithm of both sides (ln or log—it doesn't matter).

$$\ln 0.5^x = \ln 211$$

Use the property of logarithms that brings the exponent down in front.

$$x \ln 0.5 = \ln 211$$

Divide both sides by $\ln 0.5$ to solve for x.

$$x = \frac{\ln 211}{\ln 0.5} \approx -7.7211$$
